

Sales Customer Analysis

Overview

This notebook explores the part of the **Classic Models** sample database which is sales customer analysis using SQL and Python. The database contains business data for a fictitious company that sells classic car models, and it includes the following key tables:

- `customers` : Information about clients worldwide
- `employees` : Sales staff and reporting structure
- `offices` : Office locations
- `payments` : Customer payments history

Purpose

The goal is to run 25 useful SQL queries to extract business insights such as:

- Customer distribution by country
- Sales performance and revenue
- Employee hierarchy and office staffing
- Payment trends and customer behavior

Tools Used

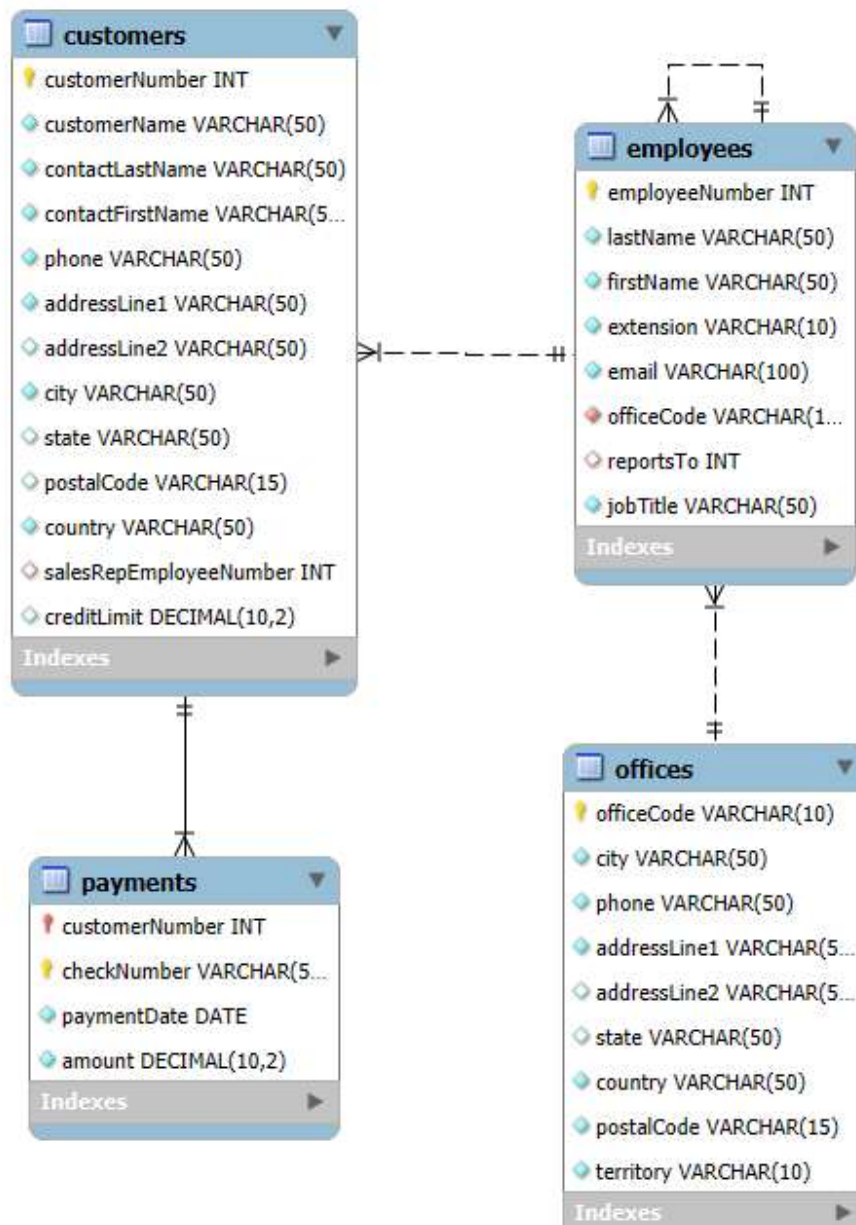

- **SQLAlchemy**: For MySQL database connection
- **pandas**: To display query results in clean tabular form

Key Insights

- Identify top-paying customers and underperforming regions
- Understand how employees are distributed and managed
- Spot customers without sales reps or payment records
- Track revenue by month and by office

ERD (Entity-Relationship Diagram)

Below is the **Entity-Relationship Diagram (ERD)** showing the relationships between tables in the database:

Code

```
In [5]: import pandas as pd
        from sqlalchemy import create_engine

        # Create SQLAlchemy engine
        username = 'root'
        password = '*****'
        host = 'localhost'
        database = 'classicmodels'

        engine = create_engine(f'mysql+mysqlconnector://{username}:{password}@{host}/{database}')

        # Dictionary of SQL queries
        queries = {
```
